## AIR HANDLING UNIT

## GIL Tajhiz Tahvieh Company / Rasht - Iran

## Features

In all Azar Nasim air handling units the frames are made from aluminum profiles while the chassis and body panels are made from galvanized steel sheets in appropriate thicknesses. Azar Nasim air handling units are manufactured in some features of which are offered below. All units are completely painted in the proper thickness.

1. Fan section:

In this section double width-double inlet centrifugal fans with forward curved blades are normally used for low pressure downfall requirements as opposed to fans with backward curved blades which are for high pressure downfall applications. Fans and housings are made of galvanized steel each set offaplus other related components such as shafts are statically and dynamically balanced, shafts are selected from proper material and size.Other power transmission components such as pulleys and belts are also suitably chosen depending on the required fan speed and electric motor power. Fan(s) and the corresponding electric motor(s) are installed on an independent chassis which is itself installed on the main chassis using vibration dampers in order to eliminate transfer of vibrations to the structure. To further reduction the effects of vibrations, fan outlet (s) are also connected to the structure via flexible material such as canvas. Where an air washer section is included, the blower electric motor is installed outside of this section to prevent adverse effects of moisture. In other cases, blower electric motor is installed in the fan section. All $380 \mathrm{~V} / 30 / 50 \mathrm{hz}$ electricmotors are selected with insulation class of (f) and
ingress protection of (ip -54). Electricmotors with ingress protection of (ip-55) are also available upon request.
2. Coil section:

This section may include cooling and heating coils or either one of the two depending on the Requirement.
Cooling coils are available in two types of chilled water and direct expansion (D.X.) As per client's requirements. The chilled water coils are constructed of 5/8"0.D copper tubes plate finned ( $8,10,12$ or 14 fpi ) in aluminum or copper upon request. The DX Coils are constructed of $3 / 8^{\prime \prime}$ OD copper tubes also plate finned ( 10,12 or 14 fpi ) in aluminum or copper as required. The chilled water for cooling coils is to be supplied by a water chiller and in the D.X. coils cooling is provided through the use of refrigerant such as R-22, R-407c or R-134a.
Chilled water coils may be requested in 4 , 6 \& 8 rows and as to the D.X. coils; they are available in 4 or 6 rows configurations. Heating coils are available in two types of hot water and steam. The hot water coil just like chilled water coil is offered in $1,2,3$ \& 4 -row configurations. Steam heating coils are constructed of $1 / 2^{\prime \prime}$ seamless steel pipe spiral finned in aluminum or copper. Coils in $1 \& 2$-row configurations are available upon request.
3. Mixing box section:

This section is where the fresh and return air streams are mixed. An independent air damper is included for each air stream.
Dampers are manufactured from aluminum in opposed blade configuration and air sealed through the use of rubber strip gasket.

Damper actuators maybe easily installed when required. 2 inches Washable aluminum filter modules are arranged in (V) type configuration inside these boxes. Housing for pleated type air filters may also be considered in the mixing box.
4. Special filter section:

This section may include pleated or bag filter which are installed as per customer requirements. Efficiency and class of special filters are specified by the client.

Notes:

- Allowable air velocity must be over the special filter section.
- In cases where only pleated filters are required they are easily installed in themixing box and not in the special filter section.

5. Multi-Zone Section:

In some cases the air conditioning design of a building defines different zones to be air conditioned, each zone requiring its own air flow rate and air temperature. In these cases instead of using a few air handling units, a multi -zone unit is usually installed. Inthemulti-zone air handling unit, cooling and the heating coils are paralleled with each other which means that some of the air passes over the cooling coil and the remainder passes over the heating coil and at the outlet the result is a mixture of the two which has the suitable temperature for each zone. Inmulti-zone units the cooling coil area is the same size as that of a regular air handling unit while the size of the heating coil is less. For each zone two outlet dampers
are installed one which is on the cooling coil side and one that is on the heating coil side active. When outlet damper is open, the other one is close. The same amount, therefore, by adjusting the outlet dampers for each zone, the desired zone temperature is controlled. Number and the effective area of dampers for each zone are dependent on the number of zones and the air flow rate needed for that zone. These aluminum dampers are located either on top or the blank side of this section depending on the type of air handling unit is up blast or horizont al blast discharge. Multizone section is usually installed after the fan section and in order to have the proper air flow over the coils air diffuser is also installed. Humidifiers are also installed in this section when required.

## Selection procedure

The first parameter to consider in the selection of an air handling unit is the required air flow rate (CFM) therefore, by having the required air flow rate, coil face area and the available nominal air flow rate for the unit, the appropriate model may be chosen. Notes:
Allowable air velocity over cooling coils is less than 550FPM.In air handling units equipped with air Washers this allowable airvelocity shall be reduced further to less than 500 FPM.
Considering the cooling and heating loads and the entering air conditions. The number of coil rows, pressure drops on both water and air sides and the required model of fan may be determined using the data available in the catalogue. Other components and accessories such as air mixing box, special filters, humidifier, etc. May also be selected from the ccatalogue as needed.

Chilled water Cooling, Hot water Heating Given:
Required air flow rate $=10000$ CFM
Cooling entering air condition $=80 \mathrm{FDB}, 67 \mathrm{FWB}$
Heating entering air condition $=60 \mathrm{FDB}$
Entering chilled water temp. $=45 \mathrm{~F}$ Leaving chilled water temp. $=55 \mathrm{~F}$ Entering hot water temp. $=180$
F Leaving hot water temp. $=160 \mathrm{~F}$ Total cooling load $=480 \mathrm{MBH}$
Total heating load $=700 \mathrm{MBH}$ Cooling $\&$ heating coil FPI = 14
External static pressure drop. $=0.78 \mathrm{In}$ W. G Maximum coil face velocity $=500$ FPM
Filter arrangement = V - type
Considering the required airflow rateincfm and the uninominal airflow rate, model
AHU-1000 is chosen. From table 5a the given cooling capacity and the chilled water temp. A 6-Rows coil are chosen. (Cooling capacity of the unit is 498 MBH ) From table 7a the given heating capacity and the hot water temp. A
2 - Rows coil are chosen. (Heating capacity of the unit is 726 MBH ).
Note: Incases where there rquirement for number of fin per inchis not specified, a coil with the least number Of rows with $8,10,12$ or 14 FPI which fulfills the requirement is chosen.

Preference is usually given to 14 FPI .

- Determine the actual coil face velocity.
F.V. Actual $=\frac{\text { CFM }}{\text { F.A }}=\frac{10000}{20}=\mathbf{5 0 0}$ F.P.M
- Knowing the actual coil velocity and the coils chosen, determine the total internal air side pressure downfall for the unit. From the table
P.D. Cooling coil $=$ P. D. (Table 17) $\times$ C.F. (T able
$10 \mathrm{~A})=0.85 * 1.45=1.19 \ln$ W.G
P.D. Heating coil $=$ P. D. $($ Table 17 $) \times$ C.F.
$($ Table 10A $)=0.22 * 1.45=0.32 \ln \mathrm{~W} . \mathrm{G}$
P.D. Filter $=0.099 \ln$ W.G
P.D. Accessories $=0.05+0.06=0.11 \mathrm{In}$ W.G
(damper \& mixing box from table 18).
Total internal pressure drop (T. I.P .D)
Tot al external pressure drop (T.E.P .D)
T.I.P .D = P.D. Cooling coil + P.D. Heating c o il + P.D. Filter + P.D. aaccessories
T.I.P $. D=1.19+0.32+0.099+0.11=1.719 \ln$ W.G Total static pressure (T.S.P)= T.I.P .D + T.E.P .D = $1.719+0.78=2.5 \ln \mathrm{~W} . \mathrm{G}$
Therefore, by using table 1 and performing interpolation the required fan size is determined as 22 " at the speed of 703 RPM and electric motor power requi rement of 10 HP .
- Determine the water side P.D. (Cooling Coil):

Water flow rate (GPM) $=\frac{\text { Total heating load }}{500 \times \Delta T}=\frac{498000}{500 \times 10}=$
$\rightarrow=99.6 \mathrm{GM}$
Water velocity inside the tubes =
$\rightarrow \frac{\text { Water Flow Rate (GPM) }}{\text { No. of coils } \times \text { No. of circuits (Table 19) }}=1.235=$

$$
\rightarrow \frac{99.6}{1 \times 28}=\times 1.235=4.39 \mathrm{Ft} / \mathrm{Sec}
$$

- From table 21 consideringthe 6 rows cooling coil, the water velocity of $4.39 \mathrm{Ft} / \mathrm{Sec}$ the pressure drop is given as 10.52 Ft . W.G.
-Determine the water side pressure drop (Heating Coil):

Water flow rate (GPM) $=\frac{\text { Total heating load }}{500 \times \Delta T}=\frac{726000}{500 \times 10}=$
$\rightarrow=72.6$ GM
Water velocity inside the tubes =
$\rightarrow \frac{\text { Water Flow Rate (GPM) }}{\text { No. of coils } \times \text { No. of circuits (Table 19) }}=1.235=$

From Table 21 considering the 2 row heating coil, the water velocity of $3.2 \mathrm{Ft} / \mathrm{Sec}$, the pressure drop is given $2.62 \mathrm{Ft} w . g$ and a. The average water temp, of 170 F correction factor is 0.77 theref ore, the actual P.D. is 2.02 Ft W.G.

## D.X. COOLING, STEAM HEATING Given:

Required air flow rate $=9500$ CFM
Cooling entering air condition $=80^{\circ} \mathrm{FDB}, 67^{\circ} \mathrm{FWB}$
Heating entering air condition $=60^{\circ} \mathrm{FDB}$
Total cooling load $=450 \mathrm{MBH}$
Total heating load $=950$ MBH
Cooling coil FPI = 14
Heating coil FPI = 8
Evaporating temperature $=45^{\circ} \mathrm{F}$
Steam pressure $=5 \mathrm{psig}$
External static pressure downfall. $=0.5 \mathrm{in}$. WG
Maximum coil face velocity $=500$ FPM
Filter arrangement = flat type
Considering the required air flow rate in cfm and the unit available nominal air flow rate, air handling unit model AHU- 1000 is chosen.

- Fromtable 9民 the givenwilling capacity and the evap. temp. a 6-rows chosen (willingcapacity of the units is 471 MBH )
- Fromtable 8Qthe given heating capacity and the steampressure of 5psig, a 2-rows heating coil is chosen.
(Heating capacity of the unit is 980 MBH )

Determine the actual coil face velocity.
Actual F.V. $=\frac{C F M}{\text { F.A }}=\frac{9500}{20}=475$ F.P.M
Referring to the correction factors in table 12, the cooling and the heating capacity correction factors are given as 0.97 And 0.98 Respectively.

- Corrected cooling capacity = $471 \times 0.97=456.8 \mathrm{MBH}$
- Corrected heating capacity= $980 \times 0.98=960.4 \mathrm{MBH}$

Therefore, the chosen cooling and heating coils fulfill the requirements.

- Knowing the actual coil face velocity and the coils chosen, determine the total internal air side pressure drop for the unit.
P.D. DX coil $=$ P.D. (Table 17) $\times$ C.F. (Table 17A) $=\rightarrow$ $\rightarrow 0.79 \times 1.45=1.15$ in W.G
P.D. Heating coil $=$ P.D. (Table 17) $\times$ C.F. $\rightarrow$ $\rightarrow($ Table 10 A$)=0.21 \times 1=0.21$ in W.G
P.D. Filter $=0.09$ in W.G (table 9)
P.D. Accessories $=0.05$ in W.G (Table 18) $\rightarrow$
$\rightarrow$ Total internal pressure d downfall. (T. I.P .D) $\rightarrow$
$\rightarrow$ Tot al external pressure downfall (T.E.P.D)
T.I.P.D = P.D. DX Coil + P.D. Heating coil $+\rightarrow$
$\rightarrow$ P. D. Filter accessories $=\rightarrow$
$\rightarrow 1.15+0.2+0.09+0.05=1.5$ in W.G

Total static pressure(T .S.P) = T.I.P .D + T.E.P .D $\rightarrow$ $\rightarrow=1.5+0.5=2$ in W.G

Therefore, by using table18 and performing interpolation the required fan size is determined as22" At the speed of 629 RPM and electric motor power requirement of 7.5 HP .

Note: - Hot water Entering: $180^{\circ} \mathrm{F}$ \& Leaving: $160^{\circ} \mathrm{F}$

- $\quad$ LVG $=$ Leaving air Temperature.
- $E D B=$ Entering air dry bulb Temperature.
- $M B H=1000 \mathrm{Btu} / \mathrm{hr}$.

1. Aluminum Washable

High capacity, low resistance, permanent metal filters, which can be Cleaned in hot water with detergent. They can be used for air cleanliness Required 65-70\% arrestance or as an economical alternate to disposable Type pre - filter of high efficiency filter.

| EU Class | 2 |
| :--- | :---: |
| Arrestance $(\%)$ | $65-80$ |

2. Panel Filter (Disposable)

Heavy duty disposable panel filters giving primary protection to the Conditioned space or protect more expensive secondary filters. They are available in synthetic fiber pleated media consist of continuous Filament fiber glass of progressive density.

| EU Class | 3 | 4 | 5 |
| :--- | :---: | :---: | :---: |
| Arrestance (\%) | $80-90$ | $90-95$ | - |
| Dust Spot Efficiency (\%) | $20-25$ | $25-40$ | $40-60$ |

## 3. Bag Filter

When high performance air filtration long service life and high dust Holding capacity required in air handling unit, then extended surface Pocket
 filters are selected. Filters are available in various efficiency depths, And number of pockets. Dust holding capacity is maximized because dirt is Evenly loaded throughout the entire depth of the filter.

| EU Class | 6 | 7 | 8 | 9 |
| :--- | :---: | :---: | :---: | :---: |

## 4. Hepa Filters

Hepa filter are used to remove airborne biological contaminants in hospital Critical area. Pharmaceutical processing industries as well as to meet exact Requirements of the laboratories and precision manufacturing and micro Electronic industries. Filters are available in 99.97 or $99.99 \%$ efficiency With plywood or galvanized steel casing. Hepa filters are installed on specially Designed knife edge type seal framing system with pressure tight lock to Prevent air by pass.

| EU Class | 11 | 12 | 13 | 14 |
| :--- | :---: | :---: | :---: | :---: |
| Dust Spot Efficiency (\%) | $99.9-99.97$ | $99.97-99.99$ | $99.99-99.999$ | $99.999-99.9995$ |

Azar Nasim air washers are designed \& manufactured in three basic classes.

## Class 4:

A compact \& economical single spray nozzle bank air washer specially designed for effective humidifying and air washing purposes.

Class 6:
A single spray nozzle bank unit for medium capacity applications, the ideal air washer for most types evaporative Cooling \& air washing tasks.

## Class 8:

Highly efficient heavy duty units with two spray nozzle banks used whenever the utmost in heat transfer humidification or air cleaning is required.

Casings and water basins are made of galvanized steel sheets. Basins are 300 mm deep for classes $4 \& 6,400 \mathrm{~mm}$ deep for class 8.

Moisture eliminators installed side by side in close proximity of each other preventing the water droplets From entering the fan section. They also present a large surface area against which water droplets \& dust Particles first impinge before ending up in the basin.

Centrifugal spray nozzles, contain no cores, vanes of obstructions of any kind and all inside surface are Smooth. Nozzles have removable caps which can be taken off for cleaning purposes.

Brass flooding nozzles are installed on separate headers extending across the air washer. They deliver a Solid flat stream of water on to the eliminator surface in order to wash off the dust particles \& deposits.

An access door with glass inspection window is available on all models.

Make - up water connection \& an automatic float valve which controls the water level in the basin are Provided.

Quick fill connection to which the fresh water supply may be connected is furnished for rapid filling of the Basin.

## Evaporative Cooling Efficiency (E) / Class 4

| Table A |  |  |  |  |  |

Given: Entering air DB temperature $=95^{\circ} \mathrm{F}$
Entering air WB temperature $=63^{\circ} \mathrm{F}$
Sensible cooling load $=85 \mathrm{MBH}$
Design air flow rate $=10000$ CFM
Room DB temperature $=77^{\circ} \mathrm{F}$
Determine the required air washer model,
$Q=1.085 \times C F M \times$ (D.BRoom, $-D . B$ Lvg.)
D.B Lvg. $=$ D.B Room $=77-\frac{85000}{1.085 \times 1000}=69.16 \mathrm{~F}$

Considering the required air flow rate in CFM \& the unit available nominal air flow rate, air handling unit Model AHU-1000 is chosen.
Evaporative cooling efficiency ( E ) is determined as,
$E=\frac{\text { D.B. Ent - D.B. } \operatorname{Lvg}}{\text { D.B. Ent - W.B. Ent }}=\frac{95-69.16}{95-63}=\mathbf{0 . 8}$
The coil face area for model 1000 is $20 \mathrm{ft}^{2}$ therefore.
F.V $=\frac{10000}{20}=\mathbf{5 0 0} \mathrm{FPM}$

Considering the air velocity \& the values in table (A) the (E) value for Class 4 air washer is equal to 0.555 Which is less than the calculated value therefore Class 4 air washer dose not fulfill the requirement. In This case since the ( $E$ ) value is known, the (P.F) value from table $(B)$ is determined as being equal to 0.75 Now, considering the unit model AHU-1000, the (P.F) value \& table (C) the (P.F) value for Class 6 air Washer is less than the value calculated therefore; Class 8 washer fulfills therequirement. We also notice that the (P.F) value given is 0.821 , the actual ( $E$ ) value is 0.856 (Table B) the Lvg. Air DB temperature is given as.
$D B L v g=D B E n t-E \times(D . B E n t-W B E n t)=95-$ $0.821 \times(95-63)=68.7^{\circ} \mathrm{F}$
Therefore, the actual air washer cooling capacity is given as.
$\mathrm{Q}=1.085 \times \mathrm{CFM} \times(\mathrm{D} . \mathrm{BRoom}-\mathrm{DB} \operatorname{Lvg})=1.085 \times$ $10000 \times(77-68.7)=90055 \mathrm{BTU} / \mathrm{hr} . \sim 90 \mathrm{MBH}$ Entering the metric chart with the leaving air DB \& WB temperatures of $68.7^{\circ} \mathrm{F} \& 63^{\circ} \mathrm{F}$ Respectively, the relative humidity of the air is determined to be 73\%.

## Note:

Abbreviations Ent \& Lvg. notes air Entering \&
Leaving air washer.
